Key Insights

- **Cash collection lags invoicing structurally:** A persistent gap between billed revenue and cash received is driving elevated receivables risk.
- **Aging signals systemic collection failure:** A material share of AR sits in **90+ days**, indicating structural issues rather than short-term timing delays.
- **Risk is concentrated in Small Business customers:** Small Business accounts drive the largest share of outstanding AR, increasing credit risk concentration.
- **Disputes are not the primary drag on cash:** Disputed revenue represents a small portion of total AR, confirming that delayed cash is driven mainly by **collection effectiveness**, not billing disputes.

Key Insights

- **Overdue AR is widespread:** 94.78% of total Outstanding AR is already overdue, indicating a broad collections issue rather than a timing mismatch. This suggests weak payment discipline or insufficient follow-up across the portfolio.
- **High-risk balances dominate overdue AR:** 88.26% of overdue AR sits in the 90+ bucket, meaning most late balances have crossed into statistically low-recoverability territory. Without intervention, write-off risk is material.
- **Overdue risk is widely distributed across customers:** The top 10 customers account for only 12.42% of overdue AR, confirming that exposure is not driven by a small set of problem accounts. Collection improvement must focus on process and policy, not just escalation of a few customers.

Key Insights

- **Disputes are materially driving aged AR:** 93% of disputed AR is overdue and 79% sits in 90+, confirming disputes are a structural cash blockage, not a timing issue.
- **Risk is concentrated and preventable:** Pricing and duplicate invoice disputes dominate 90+ AR, with Small Business and Mid-Market driving most exposure, pointing to upstream billing and pricing control gaps.
- **High resolution rate masks backlog risk:** Despite a **95.6% dispute resolution rate**, high-value disputes are not being cleared before aging into **90+ days**, indicating prioritization gaps rather than volume constraints.
